

Q.1

$4000 \times 3000 = 12,000,000 \text{ pixels} \times 3 \text{ bytes / pixel} = 36,000,000 \text{ bytes} = 36\text{Mb}$

- a. $36,000,000 / 56,000 = 642.86 \text{ seconds}$
- b. $36\text{M} / 1\text{M} = 36 \text{ seconds}$
- c. $36\text{M} / 10\text{M} =$
- d. $36\text{M} / 500\text{M} = 0.072 \text{ seconds}$
- e. $36\text{M} / 1000\text{M} = 0.036 \text{ seconds}$

Q.2

- a. $4000\text{-bits} = 500\text{bytes}$, $0.5\text{kb}/100\text{kbps} = 0.005\text{s} = 5\text{ms}$
- b. $6 \times 10^7 \text{ m} / 2 \times 10^8 \text{ m/s} = 3 \times 10^{-1} \text{ seconds} = 0.3\text{s} = 300\text{ms}$
- c. $5\text{ms} + 0.3\text{s} = 305\text{ms}$

Q.3

- a. $1920\text{-bits} = 240\text{bytes}$, $0.24\text{kb}/64\text{kbps} = 0.00375\text{s} = 3.75\text{ms}$
- b. $3.9 \times 10^7 / 2 \times 10^8 \text{ m/s} = 1.95 \times 10^{-1} \text{ s} = 0.195\text{s} = 195\text{ms}$
- c. $195\text{ms} + 3.75\text{ms} = 198.75\text{ms}$

Q.4

- a. $10^7 \text{ bit/s} \times 50 \times 10^{-3} \text{ s} = 5 \times 10^5 \text{ bits} = 0.5\text{Mbit}$
- b. $10^9 \text{ bit/s} \times 10^{-3} \text{ s} = 10^6 \text{ bits} = 1\text{Mbit}$

Q.5

- a. $21\text{Gb at } 18,000\text{m}/3600\text{s} = 4.2\text{Gb} / \text{m} / \text{s}$
 $4.2\text{Gb}/\text{m}/\text{s} > 150\text{Mb}/\text{s}$
 $4,200\text{Mb}/\text{m} > 150\text{Mb}$
 $4,200/150 > \text{m}$
 $28 > \text{m}$

The pigeon has a higher data for distances up to 28m.

- b.
 - i. The left side of $4.2\text{Gb}/\text{m}/\text{s} > 150\text{Mb}/\text{s}$ doubles with the pigeon speed, so the distances doubles to 56m.
 - ii. Again the left side of the initial equation doubles, so the distance doubles to 56m.
 - iii. The right side of $4.2\text{Gb}/\text{m}/\text{s} > 150\text{Mb}/\text{s}$ doubles, so the distance is halved to 14m.

Q.6

$80,000\text{Mb}/150\text{Mbps} = 533.33\text{s}$ - faster

$100\text{km}/72\text{km/hr} = 1.389 \text{ hrs} = 5,000\text{s}$

Modulation Schemes

Q.1

Synchronization may be difficult as there can be long series without change, like the 7 ones in part b.

Q.2

It partially solves it, as it causes long series of ones to have changes, but not long series of zeros.

Q.3

- a. $A = 10 = 1010$
 $9 = 1001$
 $D = 13 = 1101$
 $F = 15 = 1111$
 4b input = 1010 1001 1101 1111 1111
 5b output = 10110 10011 11011 11101 11101
- b. $F = 1111$
 $2 = 0010$
 $5 = 0101$
 $7 = 0111$
 $0 = 0000$
 4b input = 1111 0010 0101 0111 0000
 5b output = 11101 10100 01011 01111 11110

Yes, it solves the problem as no combination of the 5b outputs has more than 3 consecutive 0's.
